Name: vaishnavi rajendra gayake

Subject:AIML

College name:T.b.girwalkar polytechnic college ambajogai

Branch:electronics and computer

Q1.(Basic try-except)

```
try:
 num1 = float(input("Enter the first number: "))
 num2 = float(input("Enter the second number: "))
 result = num1 / num2
 print("Division =", result)
except ValueError:
 print("Please enter valid numeric values.")
```

Q2.(Handling ZeroDivisionError)

```
try:
 num1 = float(input("Enter the first number: "))
 num2 = float(input("Enter the second number: "))
 result = num1 / num2
 print("Division =", result)
except ZeroDivisionError:
 print("Error: Division by zero is not allowed.")
except ValueError:
 print("Error: Please enter valid numeric values.")
```

Q3.(Multiple except Blocks)

```
try:
    num1 = float(input("Enter the first number: "))
    num2 = float(input("Enter the second number: "))
    result = num1 / num2
    print("Division =", result)
    text = input("Enter a number as a string: ")
    number = int(text)
    print("Converted Integer =", number)
except ZeroDivisionError:
    print("Error: Division by zero is not allowed.")
except ValueError:
    print("Error: Please enter valid numeric values.")
```

Q4.(Using else)

```
try:
    num1 = float(input("Enter the first number: "))
    num2 = float(input("Enter the second number: "))
result = num1 / num2
    print("Division =", result)
except ZeroDivisionError:
print("Error: Division by zero is not allowed.")
except ValueError:
```

```python
    print("Error: Please enter valid numeric values.")
else:
    print("Division performed successfully!")
```

Q5.(Using finally)

```python
try:
    num1 = float(input("Enter the first number: "))
    num2 = float(input("Enter the second number: "))
    result = num1 / num2
    print("Division =", result)
except ZeroDivisionError:
    print("Error: Division by zero is not allowed.")
except ValueError:
    print("Error: Please enter valid numeric values.")
else:
    print("Division performed successfully!")
finally:
    print("Program execution completed.")
```

Q6.(Combined try-except-else-finally)

```python
try:
    num1 = float(input("Enter the first number: "))
    num2 = float(input("Enter the second number: "))
```

```
    result = num1 / num2
    print("Division =", result)
except ZeroDivisionError:
    print("Error: Division by zero is not allowed.")
except ValueError:
    print("Error: Please enter valid numeric values.")
else:
    print("Division performed successfully!")
finally:
    print("Thank you for using the program!")
```

Q7.(Practical - Age Input)

```
try:
    age = int(input("Enter your age: "))
    if age < 0:
        raise ValueError("Age cannot be negative.")
    print("Your age is:", age)
except ValueError as e:
    print("Error:", e)
```

Q8.(Multiple Exceptions in One Block)

```
try:
    num = int(input("Enter a number: "))
    result = 100 / num
    print("Result =", result)
except (ValueError, ZeroDivisionError):
    print("Error: Please enter a valid non-zero number.")
```

Q9.(Debugging Exception Code)

```
try:
    num = int(input("Enter a number: "))
    result = 100 / num
    print("Result:", result)
except ValueError:
    print("Please enter a valid number.")
except ZeroDivisionError:
    print("Error: Division by zero is not allowed.")
except Exception:
    print("Some unexpected error occurred.")
```

Q10.(Mini Project - Exception Handling)

```
while True:
    print("\n===== Simple Calculator =====")
    print("1. Addition")
    print("2. Subtraction")
    print("3. Multiplication")
    print("4. Division")
    print("5. Exit")
    choice = input("Enter your choice (1-5): ")
    if choice == "5":
        print("Thank you for using the calculator!")
        break
    try:
        num1 = float(input("Enter the first number: "))
        num2 = float(input("Enter the second number: "))
        if choice == "1":
            print("Result =", num1 + num2)
        elif choice == "2":
            print("Result =", num1 - num2)
        elif choice == "3":
            print("Result =", num1 * num2)
        elif choice == "4":
            print("Result =", num1 / num2)
        else:
            print("Invalid choice! Please select between 1 and 5.")
```

```
except ValueError:
    print("Error: Please enter valid numeric values.")
except ZeroDivisionError:
    print("Error: Division by zero is not allowed.")
finally:
    print("Operation attempted.")
```
